

iRocketLanding24

Dein Raketen-Service

Brainstorming

How it started...

Idea

- Setup
 - Pseudo 3D (2.5D) world with borders
 - A rocket spawns on a randomly positioned launch pad with a rocket
 - Randomly positioned landing-platform
- Mechanics
 - The rockets thrust and yaw can be controlled
 - Gravity simulation
 - Thrust & rotation delay for the rocket
- Goal
 - Land the rocket on the target platform without touching the borders

Iteration 1

- Pseudo 3D world (limited to X- and Z-axis)
- No obstacles
- Rocket should just touch the target pad

Iteration 2

- Pseudo 3D world
- No obstacles
- **Rocket needs to land on the target pad vertically ($\pm 5^\circ$ angle) with a max. gravitational speed**

No obstacles (empty room)

Random static obstacles

Moving obstacles

Iteration 3

- Pseudo 3D world
- **Static random obstacles**
- Rocket needs to land on the target pad vertically ($\pm 5^\circ$ angle) with a max gravitational speed

Iteration 4 - V1

- Pseudo 3D world
- **Moving random obstacles**
- Rocket needs to land on the target pad vertically ($\pm 5^\circ$ angle) with a max gravitational speed

Iteration 4 - V2

- 3D world
- Static random obstacles
- Rocket needs to land on the target pad vertically ($\pm 5^\circ$ angle) with a max gravitational speed

...

Iteration 69

1. Ping Elon on Twitter & sell technology to SpaceX 🚀
2. Get rich 🤖📈
3. Mars colony ☐
